

Master-Plate® glueable insert

MSP

Presentation

Master Plate inserts are simple elements that can be glued to any type of material without any special preparation, subsequently allowing a screwed connection to be made.

A Master Plate insert consists of a rectangular, square or cylindrical base with a nut, a tapped insert or a 316L stainless steel threaded rod.

The wide variety of shapes available offers technicians and designers multiple solutions to their fixing problems.

The adhesive, not supplied, should be chosen according to the support material (see implementation).

Applications:

Automotive, railway, nautical industry, transportation, furnishing, construction...

Typical application
